

BUSINESS REQUIREMENTS DOCUMENT

CloudSuite — Tiered Subscription Pricing Rollout

Prepared by Adham AlHers · Business Analyst Portfolio Project

1. Purpose

CloudSuite (a project-collaboration SaaS product, fictional for this exercise) currently sells a single annual-only subscription. This document defines the business requirements for launching three self-serve, monthly-or-annual pricing tiers — Starter, Growth, and Scale — and for the new billing process required to support them, ahead of engineering design work starting.

2. Stakeholders

Role	Interest / Requirement
Product Manager	Wants tiers that map cleanly to customer segments (solo, team, enterprise) and support future upsell.
Engineering Lead	Needs unambiguous proration, currency, and edge-case rules before estimating and building.
Finance / Billing Ops	Needs accurate, auditable revenue recognition and minimal manual reconciliation.
Customer Support Lead	Needs visibility into customers' plan-change history and a clear escalation path for billing disputes.
Sales	Wants existing annual customers grandfathered fairly, without a wave of cancellations at renewal.

3. Current-State Pain Points

- Every plan change is a manual, multi-day process: customer emails or calls, Sales manually calculates a prorated quote, customer approves, Finance manually adjusts the next invoice.
- No self-serve upgrade/downgrade path exists — this creates friction that suppresses upsell and frustrates customers who want to change plans immediately.
- Plan-change requests are logged in a spreadsheet with no system of record, making it hard for Support to answer billing questions or for Finance to audit changes.

4. Proposed Future-State Pricing Tiers

Tier	Target Segment	Monthly	Annual (equiv./mo)	Key limits
Starter	Solo users / freelancers	€15	€12 (20% off)	1 user, 3 projects
Growth	Small teams	€39	€31 (20% off)	Up to 10 users, unlimited projects
Scale	Growing companies	€89	€71 (20% off)	Up to 50 users, SSO, priority support

All tiers billed in the customer's local currency (EUR, GBP, or USD) based on account region, set at signup and changeable only via Support (to avoid FX-arbitrage switching).

5. Scope

In scope:

- Self-serve upgrade/downgrade between the 3 new tiers, monthly or annual billing.
- Automated proration calculation and preview before the customer confirms a change.
- Migration path for existing annual-only customers to the new tiers at renewal.
- EUR/GBP/USD currency handling.

Out of scope:

- Custom/negotiated enterprise contracts (handled by Sales outside this system, unchanged).
- New payment methods (existing card/SEPA rails only for this phase).
- Multi-currency accounts changing currency post-signup (routed to Support manually, not automated in this phase).

6. Objectives & Success Metrics

Metric	Target
Self-serve plan-change adoption	70%+ of changes handled without Support contact within 2 months of launch
Time to complete a plan change	From multi-day to under 2 minutes (instant)
Billing support tickets	No increase vs. pre-launch baseline, despite more self-serve changes happening
Existing customer churn at migration	Under 5% additional churn attributable to the pricing change

7. Process Maps

See attached process diagrams: `process_current_state.png` (manual, multi-day process) and `process_future_state.png` (self-serve, instant process with automated Finance/Support visibility). Referenced separately as they're best viewed at full width.

8. Dependencies & Assumptions

- Assumes the existing payment provider supports automated proration calculations via API (to be confirmed with Engineering in technical discovery).
- Assumes Finance's revenue recognition system can ingest an automated feed rather than manual entry — a dependency on Finance systems, not owned by this rollout.
- Assumes Legal has reviewed and approved the updated Terms of Service reflecting self-serve changes and proration policy before launch.

9. Related Artifacts

- User Stories (`user_stories.docx`) — detailed acceptance-criteria-level requirements for engineering.
- RACI Matrix & Risk Log (`RACI_Risk_Log.xlsx`) — rollout accountability and identified risks with mitigations.
