CloudSuite — Tiered Subscription Pricing Rollout

Prepared by Adham AlHers · Business Analyst Portfolio Project · August 2026

US-01 · Priority: Must-have

As a customer, I want to preview the prorated cost of a plan change before confirming it, so that I'm never surprised by a charge.

Acceptance criteria:

- Preview shows exact proration amount, new recurring price, and next billing date before confirmation.
- Preview is shown in the customer's account currency (EUR/GBP/USD).
- Customer can cancel out of the flow with zero changes applied if they don't confirm.

US-02 · Priority: Must-have

As a customer, I want to downgrade my plan mid-cycle, so that I only pay for what I need going forward without contacting support.

Acceptance criteria:

- Downgrade takes effect at the start of the next billing cycle by default (no service interruption mid-cycle).
- System checks the account isn't over the new tier's user/project limits before allowing the downgrade; if it is, the customer sees a clear blocking message with next steps.
- Confirmation email is sent immediately summarizing the change and the new price.

US-03 · Priority: Must-have

As a customer, I want to upgrade my plan mid-cycle and get immediate access to new limits, so that I'm not blocked while waiting for the next billing date.

Acceptance criteria:

- Upgrade takes effect immediately upon confirmation.
- Customer is charged a prorated amount for the remainder of the current cycle at the new tier's rate.
- New tier's limits (users/projects/features) are unlocked within 60 seconds of confirmation.

US-04 · Priority: Must-have

As a Finance Ops analyst, I want every plan change to be automatically logged with a full audit trail, so that revenue recognition doesn't require manual reconciliation.

Acceptance criteria:

- Every plan change creates an immutable log entry: timestamp, old tier, new tier, proration amount, currency.
- Log is queryable/exportable for month-end revenue recognition without engineering support.
- Any change that fails to log correctly triggers an alert to Finance Ops, not a silent failure.

US-05 · Priority: Should-have

As a Support agent, I want to see a customer's full plan-change history on their account page, so that I can answer billing questions without escalating.

Acceptance criteria:

- Account page shows a chronological list of all plan changes with dates, amounts, and currency.
- Agent can see whether a change was self-serve or agent-assisted.
- No engineering/database access required to view this — it's in the existing support tooling.

US-06 · Priority: Should-have

As a customer on the legacy annual-only plan, I want to be clearly informed before my renewal about how the new tiers map to my current plan, so that I'm not surprised at renewal.

Acceptance criteria:

- Automated email sent 30 days before renewal explaining the equivalent new tier and any price difference.
- Customer can pre-select their new tier before renewal date, or do nothing and be auto-migrated to the equivalent tier.

- A grandfathered pricing option is available for a defined transition window if Product decides to offer one (flagged as a Product decision, not assumed here).

US-07 · Priority: Must-have

As an Engineering lead, I want currency conversion rates locked at the moment of each transaction, so that proration calculations are consistent and auditable even if exchange rates move later.

Acceptance criteria:

- Each transaction stores the exact rate used (if applicable) alongside the amount.
- Re-running a proration calculation for audit purposes on a historical transaction returns the same result using the stored rate, not a live rate.
